Neel Gali

Software Engineer – Distributed Storage & Infrastructure
neelgali7@gmail.com | +1 (475) 291-1455 | Remote

Summary

Software Engineer with 2+ years of experience building and operating **high-performance, distributed data systems** that prioritize reliability, consistency, and low-latency access. Strong background in **Java-based distributed services, multi-threaded systems, NoSQL databases, and caching layers**, with hands-on experience optimizing storage paths used by high-throughput applications. Passionate about developer experience and building foundational infrastructure that scales invisibly.

Technical Skills

Languages: Java, Go (working proficiency), Python
Distributed Systems: multi-threading, concurrency control, consistency models, fault tolerance
Databases: NoSQL (DynamoDB, Cassandra-style systems), SQL fundamentals
Caching & Performance: Redis, Memcached, in-memory caching strategies
Messaging & RPC: Kafka (producer/consumer patterns), gRPC fundamentals
Systems & Reliability: latency optimization, throughput tuning, observability
Infrastructure: cloud-native services, service-oriented architectures
Engineering Practices: code reviews, load testing, production ownership

---

Professional Experience

Epic Solutions
Software Engineer II
June 2025 – Present

- Designed and owned **high-throughput backend services** responsible for reading, aggregating, and serving data under strict latency and availability requirements.
- Implemented **concurrent and multi-threaded processing logic** to safely handle large volumes of requests while minimizing contention and tail latency.
- Built **data access abstractions** to isolate application services from underlying storage implementations, improving consistency and developer ergonomics.
- Integrated **caching layers** to reduce database load and improve read performance for hot paths, tuning eviction and TTL strategies based on access patterns.
- Diagnosed and resolved performance bottlenecks through profiling, load testing, and metrics-driven analysis.
- Collaborated with platform and application teams to ensure storage behavior aligned with product scalability needs.

Samay Systems LLC
Software Engineer I
July 2024 – June 2025

- Developed **data-intensive backend services** interacting with NoSQL data stores, focusing on correctness, throughput, and failure handling.
- Implemented **idempotent write and retry-safe read patterns** to support reliable data access in distributed environments.
- Assisted in optimizing **database schema and access patterns** to reduce latency and improve scalability under growth.
- Added observability hooks to track query performance, cache hit ratios, and system health.
- Participated in on-call rotations, performing root-cause analysis and implementing long-term reliability improvements.

Monarch Tractor
Software Development Engineer Intern
June 2023 – August 2023

- Built backend automation services that interacted with persistent storage layers to support operational workflows.
- Designed background jobs with **concurrency control and retry logic** to ensure correctness during partial failures.
- Integrated third-party services and internal APIs while maintaining consistent data state across systems.
- Gained hands-on experience debugging production systems and improving reliability through logging and metrics.

ZeMoSo Technologies
Associate Software Engineer
July 2021 – August 2022

- Implemented backend APIs supporting **high-volume, data-driven workflows** with strict performance expectations.
- Worked with relational and NoSQL data stores, optimizing queries and access paths for predictable latency.
- Collaborated with frontend and platform teams to ensure backend systems supported fast, reliable user experiences.
- Participated in production support and post-incident analysis to improve system stability.

Projects

High-Performance Data Access Layer

- Built a service layer abstracting database interactions to provide consistent, low-latency access across consumers.
- Implemented caching and concurrency controls to improve throughput and reliability under load.
- used in-memory stores to reduce database pressure and improve response times for hot data.

Education

Master of Science in Computer Science
Oklahoma State University

Bachelor of Technology in Computer Science
JNTU Hyderabad
