# Neel Gali

Software Engineer
neelgali7@gmail.com | +1(475)-291-1455

## Summary

- Software Engineer II with 3+ years of experience building enterprise-scale cloud services focused on reliability, incident management, and operational excellence.
- Proven ability to design and ship production-grade backend systems, apply AI/ML techniques to operational data, and turn large-scale service signals into actionable insights that reduce Time to Mitigation (TTM) and improve customer trust.
- Strong collaborator in cross-functional, globally distributed teams, with hands-on experience across the full engineering lifecycle—from problem discovery and prototyping to live-site operations and continuous improvement.

## Skills

**Languages**: Python, C#, Java, JavaScript
**Cloud Platforms**: Microsoft Azure (App Services, Azure Functions, Storage, Monitor), AWS (foundational)
**AI / ML & Automation**: Prompt engineering, context engineering, model evaluation, signal enrichment, rule + ML hybrid systems
**Data & Telemetry**: Kusto (KQL), structured logging, metrics, traces, event-driven architectures
**Reliability Engineering**: Incident management systems, on-call tooling, root cause analysis (RCA), post-incident reviews
**Distributed Systems**: Scalable backend services, fault tolerance, retries, circuit breakers
**DevOps & Engineering Excellence**: CI/CD pipelines, code reviews, automated testing, live-site support

## Professional Experience

**Epic Solutions** *Jul 2025 – Present*
**Software Engineer II**
*Cloud Operations Platform (Enterprise SaaS)*

- Designed and delivered backend services supporting a centralized incident management platform, enabling on-call engineers to triage, mitigate, and resolve service incidents efficiently across multiple cloud workloads.
- Built event-driven ingestion pipelines to collect incidents, alerts, and operational signals from distributed services, normalizing data to support analytics and AI-driven insights.
- Applied AI-assisted workflows (prompt + context engineering) to summarize incident timelines, surface recurring patterns, and recommend mitigation steps, reducing manual cognitive load for responders.
- Implemented KQL-based analytics over large volumes of incident and telemetry data to identify trends, correlate signals, and support proactive reliability improvements.
- Improved service reliability by introducing health probes, retries, circuit breakers, and automated validation, preventing cascading failures during high-severity incidents.
- Actively participated in live-site operations, including on-call rotations, incident response, root cause analysis, and post-incident reviews, driving long-term fixes rather than short-term patches.

**Samay Systems LLC** *July 2024 – Jun 2025*
**Software Engineer I**
*Cloud Reliability & Automation Team*

- Developed cloud-native services in Azure to automate operational workflows, reducing manual incident handling and improving response consistency.

- Built internal tooling to enrich incident data with service metadata, ownership context, and historical signals, enabling faster and more accurate triage.
- Implemented data pipelines and queries using Kusto (KQL) to analyze operational telemetry and support reliability dashboards used by engineering and leadership teams.
- Collaborated across multiple teams (engineering, product, operations) to design solutions aligned with real-world on-call pain points.
- Strengthened engineering quality by writing comprehensive unit, integration, and regression tests, and by participating in structured design and code reviews.

**Monarch Tractor** *Jun 2023 – Aug 2023*
**SDE Intern**
*Enterprise Cloud Services*

- Assisted in prototyping backend services to support incident tracking and service health monitoring.
- Implemented API integrations and background jobs with strong emphasis on idempotency, correctness, and observability.
- Gained hands-on exposure to production systems, learning best practices around debugging, monitoring, and operational readiness.

**ZeMoSo Technologies** *Jul 2021 – Aug 2022*
**Associate Developer**
*Biotech LabOps*

- Designed and implemented backend APIs supporting high-volume application workflows, emphasizing correctness, performance, and security.
- Built data-backed features that required efficient querying, transformation, and response-time guarantees under concurrent access.
- Worked closely with frontend engineers to ensure backend systems supported accessible, responsive user experiences, including predictable latency and clear error semantics.
- Participated in on-call support and post-incident analysis, strengthening skills in debugging, root-cause analysis, and long-term fixes.
- Participated in system debugging and production support, strengthening operational reliability.

## Projects

**AI-Powered Incident Insights Engine**

- **why**: On-call engineers spent excessive time parsing logs and timelines during outages.
- **how**: Built a service to generate AI-assisted summaries and insights for live incidents by combining structured incident data, KQL-derived signals, and prompt-engineered LLM workflows to produce concise, actionable summaries.

**Operational Signal Analytics Platform**

- **why**: Fragmented data limited the ability to detect patterns and prevent recurring incidents.
- **how**: Developed a centralized analytics layer for incidents and service telemetry by ingesting telemetry into Kusto, built optimized KQL queries, and exposed insights through internal dashboards and APIs.

**System Health & Monitoring Framework**

- Built a Python-based monitoring layer to track latency, error rates, and throughput.
- Enabled faster incident diagnosis and improved overall system stability.

## Education

**Master's in Computer Science**, Oklahoma State University, Stillwater, OK *May 2024*
**Bachelor's in Computer Science**, JNTU Hyderabad, India *Jun 2021*
